

PROTECT YOUR FACILITY FROM WINTER WEATHER

Winterization programs through Turner Specialty Services' Rope Access Group are strategically sound solutions that ensure your process equipment is able to operate efficiently even under harsh winter conditions.

Continual winterization maintenance can save you from the dangers involved with lines freezing, which can lead to costly unplanned outages.

A single rope access team can access equipment, strip insulation, install, and repair various types of heat trace (including electrical, steam, or glycol), reapply insulation, and put the system back into service.

Our maintenance teams can install and repair heat tracing and remove any ice buildup from steam leaks that can create overhead hazards to equipment and personnel.

COST SAVINGS

At one of our base plants, we serviced **216** steam tickets, resulting in an average of **\$650** in cost savings versus scaffolding. Year to date, **rope access has saved this plant approximately \$140,000.**

A SINGLE WINTERIZATION TEAM CAN:

- Monitor Process Equipment Conditions
- Access Equipment Via Rope Access
- Isolate Equipment
- Remove and Install Insulation
- Troubleshoot, Install, and Repair Heat Trace
- De-Isolate/Put Equipment Back Into Service
- Remove Ice Buildup
